SUMMARY

Main interest of mine is "realism" in science and engineering. I believe that realism is neither a piece of specimen in laboratory, nor complicated equations on paper, nor numbers in database. Despite the beauty of the theories and simulation techniques the gap to the reality still requires interpretation of the domain experts. I have tried realistic simulations of magnetic recording materials by means of combination of micromagnetics and TEM investigations (Seoul National Univ. and Vienna Univ. of Technology, ~2011), excitation of magnetic nanoparticle by micromagnetic modeling with assistance of TEM holography (Seoul National University, ~2013), and 3-dimensional semiconductor process for 3D-NAND Flash device (Samsung Electronics, 2014). The restless study on image processing and 3-dimensional modeling lead me to a way of software engineer as well as a part leader in semiconductor industry, eventually to the Big Data and AI Society (Samsung Electronics, ~2017). With appreciation of recognition on my achievements, I have received 10 awards in last 3 years including one given by CEO (Oh Hyun Kwon). Please note that details of my works in Samsung is not permitted to describe in detail due to the security reasons.

Since 2018 I'm working as a data scientist in Korea Institute of Energy Research engaged in projects on Renewable energy evaluation, Research data platform, and Web-based materials research platform, keep pursuing realism beyond numbers and charts.
